

# Flux Barrier Stators

## Cutting Edge Technology

Many Machines are not as efficient as they could be. The improvement can be done very simple – with flux barriers. In combination with concentrated windings the flux is channeled into the most advantageous direction. The result is an increasing torque and efficiency – or alternatively the same torque within a smaller construction space. Measurements on exemplary prototypes have proven that 15% higher efficiency and simultaneously 20% outer diameter reduction is possible.

*Optimize your machines – with flux barrier technology!*
